relates generally to a wide-angle  
electro-optic (EO) combiner and a  
method of making the same. Electro-  
optic (EO) combining of light from  
multiple sources has many uses. For  
example, a desired amount of light is  
often derived from a plurality of lights

through combining. In wide-angle combining, many of the beams travel to the destination, but not all of them do. EO combiners can be used in wide-angle combining to gather more light from the rays that do not reach the destination, such that the rays that do reach the destination carry a smaller amount of energy. To be used as an electro-optic combiner, however, an optical system must be configured to keep the rays separated so that each ray's information is preserved when it reaches the destination.
