 February 8, 2020.. Q: How to solve a quadratic equation with a square root in the denominator I need to solve the following equation:

$$f(x) = x^3 + \frac{2}{\sqrt{3}}x^2 + 1 = 0$$
 I was thinking that I could use the rational root theorem, but that only works when the coefficient of x is a non-zero integer. A: If $x=0$, then it is obvious that $f(0) = 0$. If $x \neq 0$, then $x^3 + \frac{2}{\sqrt{3}}x^2 + 1 = (x - \frac{2}{\sqrt{3}})x^2 + (x - \frac{2}{\sqrt{3}}) + 1 = (x - \frac{2}{\sqrt{3}})^2 + 1$ Thus, we are left with proving that $x - \frac{2}{\sqrt{3}}$ is not a root of the polynomial $x^2 + 1$, but this is a simple and obvious calculation.

Subcutaneous edema: relevance of radiologic findings in the differential diagnosis of spontaneous deep venous thrombosis. Two cases of superficial edema of the lower extremities were evaluated radiologically and were found to be due to spontaneous deep venous thrombosis. Clinical, laboratory, and radiologic findings in both cases, and the radiologic findings in nine additional cases, were analyzed in order to further evaluate the relevance of superficial edema in the differential diagnosis of spontaneous deep venous

thrombosis. Superficial edema as an indicator of acute deep venous thrombosis was most frequent in the patients who had experienced short periods of immobilization (20 out of 25 cases), whereas it was rare in the patients who had not (only one case). Preceding trauma was not directly associated with spontaneous deep venous thrombosis, but deep venous thrombosis was more frequent in patients with head injuries (6 out of 7 cases). Superficial edema was always mild and transient. Estonia unites to strengthen border control by ATCO News 2d92ce491b
