Half of all babies and children with special needs will die without intensive medical care in the first month of life, a study published Thursday in JAMA Pediatrics found. In children under the age of 12 months, this risk is even higher. The risk is highest for kids who are born prematurely or have a high-risk pregnancy, the researchers found. They also found that babies who received medical care early in life had a higher chance of living up to 18 months after their birth. However, researchers found a link between receiving medical care from a midwife, rather than a doctor, and higher mortality rates. Get Breaking News Delivered to Your Inbox What the findings suggest "Children with severe medical conditions are at high risk, but all babies are at risk," said lead author Dr. James Witter, an obstetrician-gynecologist at Ontario's McMaster University. "It is likely that even if a baby with a low risk of medical complications is born in a hospital, the baby's doctors and nurses continue to monitor the baby until they are discharged and the baby is transferred home." Babies born prematurely may have multiple medical complications at birth, including low blood sugar and unstable blood pressure. "In addition, the medical and surgical care they receive may not be ideal," Witter explained. Babies who are born prematurely may need to stay in the hospital for a longer period of time, and the care they receive may not be as consistent as it would be in a hospital ward. Also, babies born at a small hospital may not be given access to the same level of care that a baby born in a large hospital can receive. "It is important to note that hospital births are not necessarily an indicator of a low-risk pregnancy," Witter said. In Witter's study, babies who were born in a hospital had a mortality risk that was one-tenth higher than those who were born at home d4474df7b8
