The present invention relates to a device for measuring the edge definition in a color photographic color negative film. As is known, in color negative films, particularly in the so-called orthochromatic negative color films, the different image dyes, each associated with a definite spectral transmission characteristic, are sequentially imaged in a series of well-defined color image points on the negative plate. In the orthochromatic negative films, the dyes are, for example, cyan, yellow and magenta. The edge definition of the different image points is therefore of particular importance in such a film, both for the formation of the correct image and for obtaining a good visual appearance of the image. In order to determine the edge definition of a negative film, it has been suggested that, at the printing operation, the film edges are determined in a separate printing step. In this case, a correct image is obtained on the front side of the negative film
