It's not shortsightedness, it's just too much mail to deliver. ~~~ falcolas Yeah, but there's a pile of cash in the mail delivery industry. Not to mention the entire US federal government workforce. ------ jdkee I'm not sure what is worse. The USPS sucking up a new army of postal employees to deliver mail, or the steady stream of hateful emails and advertisements that arrive in my mailbox. ------ jdkee Interesting that even the Washington Post admits the USPS is a mess... ~~~ arkitaip Not sure if the postal system is a mess, but even I receive a couple of junk mail per week. ------ tyingq I'm not sure this is a problem the US Postal Service can solve. There's too much mail and not enough labor. Edit: I'm not saying they can't solve the problem, but it sounds like what they propose is the same as what's happening today: More people employed to sort mail manually, rather than just automating the process to achieve the same thing. ~~~ jdkee Many of the automation projects are underway in the US Postal Service with more to come. The problems I see here are the growing volume of ad mail and the wholesale structure of mail delivery and collections. ------ tomjen3 An add is only an ad if you don't want to advertise. And if you don't have an ad it

Mondego - Busul Coșorilor by catalin de la calafat vs25, The Legend of Mu-sheng, written by catalin de la calafat Category:Romanian bloggers Category:Romanian YouTubers Category:Romanian YouTubers Category:1989 births Category:Living peopleQ: passing a parameter with a signal handler to a shell script? I am having trouble figuring out how to pass a parameter to a shell script. I have a signal handler in a shell script. I can pass a single string to it, but not a parameter. Do I have to modify the signal handler in some way to support passing a parameter? signal.h typedef void (*sighandler_t)(int); extern void sighandler(int signo, sighandler_t func, void *arg); signal.c void sighandler(int signo, sighandler_t func, void *arg) { printf("signo = %d, arg = %s ", signo, arg); func(signo, arg); } main.c int main(int argc, char **argv) { sighandler(SIGTERM, sighandler_handler, argv[1]); printf("Running main... "); sleep(1); printf("Exiting main... "); return 0; } A: When you send a signal, the signal is sent to the process that you are running. Therefore, when you send a signal, its handler is running in the same process, and can access the arguments you send to the signal. (The only time you don't have access to the arguments is when the signal is sent to a different process, and that other process is not your process, as when you send SIGTERM to the shell and it causes the shell to send a SIGTERM to a child process. In that case, the shell is sending a signal to another process, and that other process' signal handler is running in the other process, and is not running in your process.) When you are running the 2d92ce491b
