AutoCAD is widely used throughout the engineering and construction industry. It is used by more than 25% of the Fortune 100 companies and by more than 60,000 engineers and architects. According to a study by (2002) survey by the Office of Technology Assessment of the U.S. Congress, about 1 in 6 commercial CAD users still use the 1970s era GDS II file format and only 1 in 5 of the total 500 surveyed companies use any type of CAD file format other than.DWG or.DWF. History Autodesk acquired AutoCAD and related design software assets in 2000 and relaunched AutoCAD as a web-based subscription product on March 11, 2002. AutoCAD for mobile is a discontinued product line. In February 2015, Autodesk announced that it was shutting down AutoCAD and related services. Design AutoCAD is intended to produce drawings and drawings that are based on those in other CAD programs. The process requires substantial manual interaction, including drawing, annotation, dimensions, insertion, editing, coloration, and so forth. All of the design information is present in the drawing. The information that is not already defined is entered by the user. Like other CAD programs, the user begins by placing entities in space, which are then connected with edges. The user must define the entity types. A drawing can include both 2D and 3D entities. A 3D entity can be subdivided into sub-entities, and a 3D entity can be rotated around the x, y and z axis. Other features include the ability to define text styles, "select entities", and groups. Functions AutoCAD allows users to create a variety of shapes, ranging from the simple to complex. The user begins by creating one or more entities by placing shapes at locations defined by the coordinates of the drawings. Once the entities are defined, the user may draw or insert edges between the entities to connect them. The user may also use components that are placed on entities and are connected with edges, such as hatch patterns, hatch fills, line styles, and arc selections. Components such as dimensions, text styles, and other entities may also be placed on the entities. The user may insert curves or splines through two or more entities to define a path. The user may create a path or insert an object that will move in space, such as an arrow. The user may create labels and annotate the

NetCDF is a platform-independent, multi-dimensional data format that can store large amounts of numerical, tabular and spatially referenced data. The most common uses of NetCDF include geophysical, climate and oceanographic analyses, as well as vegetation modeling. AutoCAD is available on a number of operating systems: UNIX, Linux, Mac OS X and Microsoft Windows. Linux is the most popular platform for AutoCAD, with over 80% market share. Windows is used in smaller markets. A number of graphics drivers are available for different operating systems. UNIX Since its inception, the AutoCAD product line has been available on many UNIX operating systems, such as AIX, HP-UX, SCO UNIX, Solaris, Tru64, IRIX, and now even Linux. Solaris Since its inception, AutoCAD has been available for the following versions of Solaris: 10.0, 10.1, 10.2, 11.0, 11.1, 11.2, 11.3, 12.0 and 12.1. Windows Autodesk has continued to support Windows throughout its lifetime. Originally, Autodesk discontinued support for Windows 3.1, 3.11, and NT 3.51. These versions of Windows can no longer be used for versions of AutoCAD older than AutoCAD 2004 or later. Windows NT was only supported through version 9, and as of AutoCAD 2010 it is no longer supported. Alma 60 Alma 60 is an archaeological site located in the Colorado Front Range. The site was occupied from 5000 BCE until 900 CE, having been continuously occupied from 6000 BCE. This site is the latest identified Pre-Clovis archaeological site in the United States. Artifacts Skeletons from the site have been found with perforated and unperforated projectile points and small flakes, including retouched scrapers. All of these artifacts are characteristic of the Archaic period. Carbon dating of sediments from the site place it as the latest of the major Archaic period archaeological sites in the Front Range, in particular those dates older than 6300 BCE. Radiocarbon dating of a silty clay horizon at the site dated to between 7930 and 10,700 years ago. Bison Kills Four of the five bison kills found at the site have been radiocarbon dated to the time of the site's occupation, with an age of $11,265 \pm 95$ years ago (5500 BCE). The fifth kill was recovered from a previously unknown occupation near the site of Alma 52, dated to the same time. Site Interpretation The site is interpreted to have been a Pueblo III style site, although it has been noted that the site does not appear to represent a large population center or village. The area around the site has also been noted for its poor preservation of archaeological sites, making it difficult to determine whether the site was occupied by a larger population than the two previously identified sites. What's New in the AutoCAD?

The new DXF Import option in AutoCAD helps you efficiently import and synchronize 3D CAD models. It's been redesigned to make it easier to import DXF files into the drawing. And DXF Import has been revised to more accurately match the properties of the source file. The DXF Import option also supports 3D exports for Revit and AutoCAD Architecture. To show how you can use the DXF Import option to improve the work flow in your drafting, click here for a short video from the Creating Content for the Next Generation conference. This video shows how to efficiently import 3D models into your drawing. New Layers Properties Page in the Properties Editor: Add layers to your drawing and set common properties at once. When you import a DWG, DXF, or PDF drawing into a new drawing, new layers appear automatically. This is much more efficient than creating and deleting layers as needed to keep track of your drawing. The New Layers Properties Page makes it easy to: Set and see all properties for all layers at once. Organize layers into folders. Set up layer states. Create and attach images. When you create a new layer, this page becomes the new layer's default settings. Use the Organize Layers menu to create a new folder and assign a name to the folder. You can use the Layers list to quickly switch to a specific folder. To create a new folder in the Layers list, right-click on an existing folder and choose New Folder. Use the Labels command to add labels to existing layers. To use the Labels command, select the layers you want to label in the Layers list, and then choose Labels > Labels. You can add labels to layers individually or group them by layers. You can also change the label text and format. To change the text and format of a label, choose Format > Label Styles. In the Label Style dialog box, select the style that you want to use for the label. In the font section of the dialog box, choose the font style and size that you want to use for the label. You can also specify whether the label should be displayed on the left or right of the layer. To set a label style that you created, select a style and then choose Label > Apply Label Style. Also, use
