Full text of "Hardata Hdx Video Automation"The present invention relates to a method for manufacturing an information recording medium such as an optical disc, and more particularly to a method for manufacturing a disc having a replica substrate. In the technical field of optical discs, information recording media are widely used for storing a variety of information. In general, the recording medium is formed of an

information recording layer formed on a disc substrate of a predetermined thickness, and a transparent protective layer formed on the information recording layer. Recording and reproduction of information are performed by irradiating a recording/reproducing light beam on the information recording layer of the optical disc. Recently, from the viewpoint of an increased recording capacity and reduced size of the disc, the reduction in thickness of the optical disc (the disc thickness) is being rapidly advanced. As a result, recording and

reproduction of a plurality of information with the one information recording layer may be difficult. Accordingly, for the purpose of recording and reproduction of the plurality of information simultaneously, an optical disc having a plurality of information recording layers is under study. In order to achieve a plurality of information recording layers, the recording density of the recording layer must be increased. In order to increase the recording density, it is necessary to decrease the track pitch and the size of the optical spot formed on the

information recording layer. This causes the following problems. The maximum value of a modulation component of a read signal obtained from the optical disc decreases, and a reproduction error rate increases. As a result, it becomes difficult to reproduce the information correctly. In particular, in the case where the information recording layer of the optical disc includes a read only region and a recording region, the following problem arises. In the read only region, it is necessary to form a pattern for protecting the information recording layer and a light beam

pattern. Therefore, the track pitch and the spot size must be set to about the same level as those of the recording region. On the other hand, in the recording region, the track pitch and the spot size must be set to about one half of those of the read only region. In order to manufacture an optical disc satisfying such demands, it is necessary to design various patterns on a substrate and perform a complicated processing. The process becomes complicated and complicated conditions must be set for the processing. This increases the manufacture cost. An optical disc

has a possibility that an incorrect information may be written into a desired information recording region. In particular, an additional information is added to the main data of 3e33713323
