Tiny Shredder, the best home and small business file eraser, now available for Windows 95, 98, or XP | Softonic review PHOTOGRAPH BY STEVE EASTON SEATTLE — The worst thing that happened to the Mariners last season wasn't injuries, or a devastating losing streak, or a brutal August, or a season-ending slide, or the 2016 World Series title. It was the sudden and undeserved removal of Nelson Cruz from the roster, and the subsequent decision to trade him to the Yankees for Andrew Miller. There's not a single Mariner who doesn't think that that trade was a mistake. A few minutes after the Yankees and Mariners announced the trade last Thursday, I met with a half-dozen players, including Cruz, about an hour before they arrived at Safeco Field for a Mariners-Yankees charity softball game. Every player was asked how he felt about the trade and the Yankees signing Miller, and the answers were predictable. "He's a great player," said catcher Mike Zunino. "Obviously, we wish him all the best." First baseman James Paxton was even more pointed. "Yeah, I don't know what the hell happened," he said. "I'm not going to sit here and pretend like I do." OK, I thought. Maybe the Mariners got enough in return for Cruz for the Yankees to consider this a worthwhile trade. Then the pitchers took the mound for warmups, and the conversation turned to the game. "I thought it was a good trade for us," Pa 77a5ca646e

There's also a similar question on stackoverflow, which I can't seem to find an answer to. A: You can't easily access `$_GET` and `$_POST` in a way that requires you to set these values. If you were to pass `?foo=bar` as the method parameter of a form, and include the string `bar` as a hidden field, the `$_POST` variable would include the value `bar`. This value can only be accessed using `$_POST['foo']`. If the user enters `foo=bar`, this will be interpreted as `foo=bar`, which would be a bad thing if you have forms for user registration. To avoid that problem, you would have to set the parameter `foo=bar` in a script-generated form, which is not really convenient. If you're doing user authentication (and maybe saving session data as well), then you'd have to set these variables using the `$_GET` variable, since they don't really have a standard API for it. A: Require these values? I don't think so. I only use these for sending values via query strings. However, I still send them via GET values. Either you are not passing them, or you are using them incorrectly. Q: How do I determine whether my Wifi adapter is a 'standard wifi' adapter or a 'USB wifi' adapter? I am interested in the distinction between a 'standard wifi' adapter and a 'USB wifi' adapter. I have a Wifi USB Adapter from Belkin that has a label of: USB adapter USB 2.0 High-Speed Dlink DWA-140A There is no additional information on this label. I would like to know whether this adapter is a 'standard wifi' adapter or a 'USB wifi' adapter. Is there a list of adapters that are 'standard wifi' and 'USB wifi' or are they interchangeable? A: The term 'Standard WiFi' is a marketing term that has nothing to do with the actual technology used. It just means the device complies with the 802.11 standard and uses the common air interface (802.11a, 802.11b, 802.11g, etc.). However, USB WiFi adapters are exactly what they claim to be; devices that use a computer's USB port to communicate with other WiFi devices. That is to say,
