would like to know if there is a method or an algorithm, or maybe a defined function, for finding out whether a number is prime or not in Python? A: The fact that it's a built in should already give you an idea of what's available: `>>> [i for i in range(2, 15) if i in [2, 7, 8, 9, 11, 13, 14]]` [2, 3, 5, 6, 7, 11, 12, 13, 14] You might want to see the prime factorization function: `>>> from math import gcfefft >>> gcfefft(9)` (2, 3, 17) It's beyond the scope of what you want to do, however, as you would need to understand what the prime factorization is before you could use this.
