Not too long ago, we featured the immaculately preserved P-38 Jug in our Top 30 Military Aircraft gallery. The Jug is, in fact, not even military aircraft, but it just so happens to be the most famous American fighter aircraft ever built. We're not saying that we've never done a write-up on a civilian plane before, but we always appreciate when a plane can be torn down and

given a new lease on life. Aboard a restored P-38 The P-38 Lightning was designed by a team of US Navy men under the direction of test pilot Russell K. “Pete” Petersen. The plane’s design was an attempt to create a light fighter plane that could outperform the Luftwaffe’s Messerschmitt Bf 109. The fuselage was fabricated in-house by the Western Electric Aircraft Division, but the wings, engine, and tail section were produced by Douglas Aircraft. The Jug was the first of many projects that would be based on the Lightning, with P-38 variants including the Lightning II, the P-51D, and the P-51H. A Long and Strange Odyssey The P-38 began its life as a US Navy Consolidated Vultee XP-38, which was part of the last generation of fighter planes with a two-seat cockpit. The

What's New In AutoCAD?

Manage non-standard planes and auto-dock them to faces in the Drafting tab. Create a new tab for your custom planes and associated accessories, and easily share custom planes with others. (video: 1:14 min.) Create frames that snap to form, so they always fit correctly. Select one of your designs or a separate drawing and snap it to its frame. (video: 1:09 min.) Modify the placement of your drawing by “docking” it to the surrounding elements. You can dock

your entire drawing to a form, or just a particular element. You can choose to automatically resize your drawing to match its new location, or dock it at a specific size. (video: 1:07 min.) Add a new type of feedback by opening the Feedback dialog box and using it to quickly create new feedback types. (video: 1:03 min.) Lasso Selection improvements: Lasso Selection shapes the selection you want to make by taking points and converting them to actual shapes. It works with lines, polylines, arcs, ellipses, and rectangles. You can apply multiple constraints, at the same time, to create a better selection. (video: 1:23 min.) Lasso Selection has a new style for the edge selection. Choose a single style for multiple constraint shapes, or choose a new style for each constraint. (video: 1:08 min.) Create and edit grid objects with greater precision, faster, with the New Grid Object tool. Set the precision of your grid, including the number of decimals, and the number of grid spaces per inch. (video: 1:04 min.) Create a vector representation of the Selection Lasso to specify a selection precisely. You can specify the number of segments and the radius of the segments. (video: 1:09 min.) Measure points and other points of interest in 3D by selecting them and measuring them to create a 3D path. Choose the points to measure with the Measure Point button, and the distance is automatically computed. (video: 1:08 min.) Lasso Selection

creates a selection that you can manipulate in 3D space.
You can choose a 3D constraint. (video: 1:07 min.)
