Check out our latest updates: ConnectionsViewer is a fast and clean app for displaying and analyzing TCP and UDP connections in Windows systems. It displays both remote and local IP addresses, as well as remote and local ports. You can terminate the associated processes, using built-in and additional programs, and lookup IP addresses and processes in Google and VirusTotal. No special tools or plugins are required to use this application. Thursday, November 7, 2012 BrainDump is a tiny and lightweight Windows command line application that has been designed for enabling you to quickly dump your RAM contents. This utility can be used to dump RAM memory information that contains all pages, processes, services and other useful information that could prove to be useful in the course of your investigation. The reason why the utility is so small is because the application is really easy to use and offer detailed information regarding the memory dump itself. While not all memory dump tools come with a graphical user interface, BrainDump does not have one either. This does not mean that the software is not easy to use or that it is not of a high quality. On the contrary, it is really easy to use the program, whether you are starting it for the first time or after a long hiatus. In addition to that, you can even download this utility and check it out offline if you would like to do that. The utility is designed to be user-friendly and to offer a simple interface to it as well. As mentioned earlier, it does not come with a graphical user interface, but it does have a text-based one. However, it offers you the most advanced features found in similar programs. What is interesting is that it does not compromise on the quality of the utility, even though it does not offer a graphical user interface. To be more precise, the interface is really clean and the text-based user interface provides you with easy-to-follow instructions. In addition to that, BrainDump can be used not only on Windows systems, but also on other operating systems, such as Linux, Windows CE, Windows Mobile and Symbian. BrainDump Features: Dump memory for all pages, processes, services, network interfaces, DLLs and a whole lot more BrainDump is a compact utility for dumping the entire contents of the RAM to an organized file. The utility does not require any special installation to be used and comes in three versions, including free, demo and full versions. For

This is the UI of the program and it automatically refreshes itself in real time. It is a simple program. Very useful utility to check connections/processes. NoUI but you can perform the actions from context menu, which is very easy to use. Easy to use. Listing all processes along with their full path. Search from which processes, the executable is running. This is a very good software. Easy to use and understand. The number of listed processes are 581. Available on Microsoft Windows. MacTutor is a Mac OS X utility to retrieve and view information about the connections established between your Mac and the Internet. It has the ability to save that information to a flat file, so that it can be retrieved by other applications. The program can look for new connections, show details

about the connections already active, or simply list the IP addresses of the remote hosts connected to your Mac. The number of connections is displayed along with each of them's information, including the remote IP address, the port number, the amount of traffic and the protocol used. You can list all or only a few of the connections. In order to accomplish this, you need to either select from a list of IP addresses or use the search function. Then, the current list can be sorted according to the details of the connection and the number of connected hosts. MacTutor does not have an integrated reporting interface, but it can save all the information to a flat file and then use this information in your preferences or another application. A simple and handy app for looking up connected hosts. The program is available in English. It is a simple utility. No additional comments. The IP address is displayed along with the connection's details. New connections can be retrieved from history. You can save the results to a text file. The number of connected hosts is displayed. It is a good software. The window has a black background and gray text. The text can be difficult to read. IPVNC is an advanced Remote Desktop solution for Mac and Windows computers. It supports the connection over either the Internet or local area networks (LAN). It can be used in conjunction with mDNS or Bonjour services. The utility does not require any setup or configuration, and its interface does not have many options. Nevertheless, the interface is sufficient for its most common tasks. The program provides multiple connection profiles, supports multiple network protocols and 77a5ca646e

NoVirusThanks Connections Viewer is a small and lightweight tool which displays details about all of your network connections. It's easy to use, but it does more than simply display your connections. The program's main window displays a list of the connections currently displayed. You can select a connection and view additional details about it, such as remote IP address, destination port, remote process ID and more.

Additionally, the program displays a full report about the connection in HTML format. This file can be copied to your clipboard, saved to disk, or opened in any web browser. You can also perform a variety of actions on connections, such as terminate associated processes. Additionally, you can search for network connections using Google or VirusTotal, geolocate connections, and much more. 1.2 MB NoVirusThanks

Connections Viewer Main Features: The application displays a list of all currently displayed connections. Select a connection, view its details, and perform additional actions. The connection's details are displayed in a complete report. You can also display a complete report of all connections, or select individual connections for more detailed information. The application can also perform actions on selected connections, including terminating associated processes. You can search for network connections using Google or VirusTotal. **NoVirusThanks Connections Viewer Permissions:**

NoVirusThanks Connections Viewer may collect some information about your computer, but the information is an aggregate and does not identify you personally. In addition, NoVirusThanks Connections Viewer stores no information about the users of your computer, so this tool does not violate the privacy of users of your computer.

Download and install the application to manage your TCP and UDP connections.

What's New In NoVirusThanks Connections Viewer?

NoVirusThanks Connections Viewer is a tiny piece of software provides you with a complete list of TCP and UDP connections in a given host system. Not only can you preview all relevant details regarding each connection, but you can also perform various actions, such as terminate associated processes. Close and lookup processes as well as IP addresses with just one click The program comes with a single window interface that is populated as soon as you open it. You should bear in mind that the utility refreshes in real time, so you do not need to worry about doing it manually in case you decide to

access another service, process or application. Then again, a manual refresh command exists if you want to use it at any time. The connections are displayed along with detailed information that includes the type of protocol, local address and port, remote address and port, process ID, process path and the state, which specifies whether it is established, listening or closed. The actions of the program can be found in the context menu and consequentially, you can close all, a few or some of the connections associated with a given process. At the same time, you can lookup the processes and remote IP addresses on Google and VirusTotal, check whether they are blacklisted, geolocate and further inspect the processes' properties. A lightweight and straightforward app for managing UDP and TCP connections The application allows you to copy all or only the selected remote IP addresses to clipboard. Alternatively, you can save the full report to an HTML file that you can analyze using specialized third-party software solutions later on. regardless of whether you are trying to determine what is taking most of your bandwidth or perhaps you want to identify sneaky malware that made its way into your system, NoVirusThanks Connections Viewer could come in handy. Related to NoVirusThanks Connections Viewer How often does it take to setup VPN on Windows 10? Probably not all that often. Even if you did all of the complex configurations that could include creating or removing servers, ensuring that the entire network is being properly and securely tunneled, configuring individual devices and their routes, and all of the other tasks that could include downloading, configuring and installing multiple applications, this is a lot of work, but, you would probably get away with only once. However, now that Windows 10 is here, if you want to use a VPN, there are things that you might want to take into consideration. Here are some of them: How do I configure Windows 10 VPN? In Windows 10, a VPN can be configured with just a couple of clicks. Connect to the VPN If you want to use the VPN, you will have to connect to it. This is what the "Connect to VPN" icon in the taskbar means. You will find it next to the date and time. Enable the VPN You will have

System Requirements:

* Recommended: Intel Core 2 Duo E7400 or better, 2.8Ghz+, 4GB RAM, ATI Radeon 2600 or better, NVIDIA GeForce 8800GTX or better. * Minimum: Intel Core 2 Duo T6600, 2.4Ghz+, 2GB RAM, ATI Radeon HD 3200. * NVIDIA GeForce 9600 GT minimum. * ATI Radeon HD 2600 minimum. * At least 1024x768 or greater resolution. * Windows XP, Vista, Windows 7, Windows 8.
