iStockphoto What is Photoshop? Created by John Knoll, Photoshop has been the industry standard image manipulation program for so long that its name has become a verb. It is common parlance to say that an image has been "photoshopped," or even just "shopped," meaning that it's been edited or manipulated. It uses a layer-based editing system that enables raster image creation and altering with multiple overlays that support transparency. It's been the first and only program of its kind. The new version of Adobe Photoshop is called Photoshop Creative Cloud. Getty Images "Another early designer of the printed word was

Christopher Dresser, a printer of the Victorian age who designed the typeface used in magazines and books around the turn of the 19th century. At first he used wood cutters, but they were either too expensive or hard to make, so he began drawing his own type and was the first to use graphics to communicate ideas," said Newman. Dresser eventually invented a manual "draw-type" machine — a precursor to the typewriter — with a wheel that held individual letters. His clients loved his designs and used them in their promotional material. Later, the machine became known as a "compositor." "The word 'design' was not used in the Victorian and Edwardian eras," said Newman. "It was considered a craft, and the word 'photography' wasn't even invented yet." "In order to communicate, artists used typefaces," said Newman. "What has changed is that there are so many typefaces available on the Web that people can use photographs as their fonts. It's called 'photographic lettering.'" "The idea of creating your own lettering is a mainstay of many photographers, and that's been around since the beginning of the art form, but it was never done until computers and Photoshop," said Newman. Q: How to read a string into a char array, and then read it into a string? I am reading the contents of a file into a char array, and then reading that char array into a string. How could I change this code so that, upon reading the strings from the file, they are all placed into a string array instead of a char array? // first attempt

```
std::ifstream file; file.open("data.txt", std::ifstream::in); char text[8192]; while(file.read(text, 8192)) { char in[8192]; file.read(in, 8192); copy(in, text); string& test = test_string; } // second attempt file.open("data.txt", std::ifstream::in); char text[8192]; char* out = new char[8192]; while(file.read(text, 8192)) { file.read(out, 8192); copy(out, text); string& test = test_string; delete[] out; } A: You can do it like this: std::ifstream file; file.open("data.txt", std::ifstream::in); std::string text[8192]; std::string out; while(file.read(text, 8192)) { copy(text, out); string& test = test_string; } delete[] out; Or you could use stringstream: std::stringstream text; std::ifstream file; file.open("data.txt", std::ifstream::in); std::string
```

`text[8192]; while(file.read(text, 8192)) {
std::string str = text.str(); copy(str.begin(),
str.end(), test_string); }` Note that this way will
read the whole file into `test_string`, not only the
first 8192 bytes. Q: What should be done with
