The main window of Vocal Remover Pro is also its only window, meaning you do not need any expert skills to launch or understand the feature-set. The entire process is pretty simple, you only need to select the source file, then remove all detected vocals and save the generated file to the location you specify. Supports multiple source formats You need to manually browse to the location of your audio file, as dragging and dropping the file onto the main window will not work. The supported source formats are: MP3, M4A, WAV, FLAC, OGG and WMA. In other words, if your source file is in any other extension, you first need to convert it to one of the supported ones, before processing it. Few adjustments supported As soon as you selected the source file (only one track can be loaded at a time), you have the possibility to adjust the gain level according to your preferences. You can maintain the default value if you are unsure about its significance. On the downside, you cannot set up a naming pattern for the created files. The source filename is preserved and a prefix is added to show that the file has been prepared for karaoke.
